

Composting can convert food & garden waste into dark colored soil (humus) in a just a few weeks

Far from difficult... composting, or decomposition, occurs all the time in the natural world

WHAT IS COMPOSTING?

Composting is nature's recipe for recycling

Composting is the breaking down of waste organic materials (food & garden waste) in a large container or heap.

Decomposition is driven by the action of naturally occurring bacteria, fungi & invertebrates.

Nutrients which were once part of the living plant or animal, return to the Earth where they support the growth of new plants.
